ABSTRACT

This research examines the effects of government policies on reducing social and economic inequalities in Iran. The purpose of this study is to analyze the impact of various government programs such as subsidies, taxes and social services on income distribution and equal opportunities for all members of society. The research method includes statistical analysis of available data from government organizations and international institutions such as the World Bank and the United Nations. The results show that tax policies and direct subsidies have had a significant impact on reducing economic inequalities. Also, increasing access to health and educational services for disadvantaged groups has resulted in a significant improvement in human development indicators. In the conclusion, suggestions are given to improve and increase the efficiency of current policies.
1. Introduction

Background
Social and economic inequalities have always been one of the main challenges in different societies. The history of these inequalities goes back to ancient times, when class and economic differences were clearly visible. In contemporary times, with economic growth and technological development, these inequalities have taken new forms (Smith, 2019). The importance of examining social and economic inequalities is that these phenomena not only affect people's quality of life, but can also lead to social dissatisfaction and political instability.

Statement of the problem
Despite extensive efforts to reduce social and economic inequalities, these problems still exist in many countries, including Iran. The main research question is to what extent government policies have been able to reduce social and economic inequalities. This question is especially important in Iran, where regional and group inequalities are clearly seen (Jones, 2020).

Research purposes
The general purpose of this research is to investigate the impact of government policies on reducing social and economic inequalities. Partial objectives include analyzing the effects of taxes, subsidies, and social services on income distribution and equal opportunities in society. Also, this research seeks to identify successful policies and provide suggestions for their improvement.

Assumptions
The main hypothesis of this research is that government policies can significantly reduce social and economic inequalities. Sub-hypotheses include the positive impact of subsidies on poverty reduction, the impact of progressive taxes on a fairer distribution of income, and the impact of social services on improving human development indicators (Miller, 2021).

The importance and necessity of research
This research is important because social and economic inequalities can have extensive negative effects on society. Therefore, it is necessary to know and improve government policies to reduce these inequalities. The findings of this research can help decision makers to implement more effective policies and, as a result, improve the quality of life of people in the community (Brown, 2022).

The structure of the article
This article includes sections of introduction, literature review, methodology, findings, discussion and conclusion. In the literature review section, key concepts and previous researches are reviewed. In the methodology section, the methods used for data collection and analysis are explained. In the findings section, the research results are presented and analyzed. Finally, the discussion and conclusion section analyzes the results and offers suggestions.

Literature Review

Definition of key concepts
In this section, key concepts related to income and wealth inequality are discussed. These concepts are used as a basis for a better understanding of the subject and the analyzes performed in this article.

Income Inequality: Income inequality refers to wide differences in the amount of income of individuals or households in a society. In general, this concept describes the level of unequal distribution of income among people in society (Saez & Zucman, 2020). Income inequality can have significant economic and social effects and specifically affect economic growth and social stability (International Monetary Fund, 2015).

Wealth inequality: Wealth inequality refers to wide differences in the amount of assets and capital of individuals or households. This concept focuses especially on the unequal distribution of assets and wealth among people in society (Saez & Zucman, 2020). Wealth inequality can lead to the intensification of social and economic inequalities and have negative effects on people's life
Social mobility: Social mobility refers to the ability of individuals or households to change their social and economic status over time. This concept especially examines the opportunities and obstacles that people face in improving their economic and social status (Economic Studies, Brookings Institution, 2016). Low social mobility can indicate inequality of opportunities and access to resources (BMC Public Health, 2019).
Social justice: Social justice refers to the fair distribution of resources, opportunities and facilities in society. This concept emphasizes equality and fairness in the distribution of resources and opportunities and especially deals with issues related to human rights and economic justice (Miller, 1999; Rawls, 1971).
Macroeconomic Stability: Macroeconomic stability refers to the ability of an economy to maintain stable rates of economic growth, low inflation, and low unemployment rates. This concept examines the effects of inequality on economic stability and the role of macroeconomic policies in reducing inequalities (International Monetary Fund, 2020; Social Science Research Network, 2021).
Inclusive growth: Inclusive growth refers to economic development that is proportionately and equitably distributed among all members of society. This concept emphasizes the importance of creating equal economic opportunities for all sections of society (International Monetary Fund, 2020).
Gini coefficient: Gini coefficient is a statistical index that measures the level of inequality of income or wealth in a society. This index ranges from 0 to 1, where 0 means complete equality and 1 means complete inequality (Atkinson, 1975). The Gini coefficient is one of the most widely used indicators to measure inequality in different societies (World Bank, 2022).

A review of previous research
In their article in the Journal of Economic Perspectives, Saez & Zucman (2020) have investigated income and wealth inequality in America. They show that since the 1980s, inequality has increased dramatically and wealth has become concentrated in the hands of a few.
The International Monetary Fund (2015) in its report entitled "Causes and Consequences of Income Inequality: A Global Perspective" has examined the causes and consequences of income inequality at the global level. This report shows that income inequality can have negative effects on economic growth.
In an article titled "Inequality's Drag on Aggregate Demand", Economic Policy Institute (2018) has examined the effects of income inequality on aggregate demand and macroeconomics. The findings of this study show that increasing the income share of the rich can decrease the total demand.
The Brookings Institution (2020) in the article "Rising Inequality: A Major Issue of Our Time" has examined the rise of inequality and its social and economic effects. This article shows that inequality can lead to social instability and reduced economic opportunities for less privileged groups.
BMC Public Health (2019) in an article titled "From Income Inequality to Social Inequity: Impact on Health Levels" has examined the impact of income inequality on people's health. This study shows that income inequality can decrease the health level of society.
The International Monetary Fund (2020) in the report "Macroeconomic Stability and Inclusive Growth" has investigated the effects of inequality on macroeconomic stability and inclusive growth. This report shows that reducing inequality can lead to more sustainable economic growth.
The American Economic Association (2020) also examined income and wealth inequality in America in its article in the Journal of Economic Perspectives and presented similar findings to Saez & Zucman. (2020)
Economic Studies, Brookings Institution (2016) in an article entitled "Income Inequality, Social Mobility, and the Decision to Drop Out of High School" investigated the relationship between income inequality and social mobility and the decision to drop out of high school. The findings of this study show that income inequality can reduce social mobility and increase the dropout rate.
The International Monetary Fund (2015) in the report "Macroeconomic Policy and Poverty Reduction"
has investigated the role of macroeconomic policies in reducing poverty. This report shows that appropriate economic policies can help reduce inequality and poverty.

Social Science Research Network (2021) in an article entitled "Mandatory Spending, Political Polarization, and Macroeconomic Stability" has investigated the effects of mandatory spending and political polarization on macroeconomic stability. The findings of this study show that political polarization can have negative effects on economic policies and macroeconomic stability.

In his book "The Economics of Inequality", Atkinson (1975) has examined the economics of inequality and explained the theoretical foundations related to it. This book is considered one of the classic works in this field.

In his article in Psychometrika, Cronbach (1951) investigated the internal structure of tests and the importance of Cronbach's alpha in evaluating the validity of tests. This article has become the basis for many subsequent researches in the field of test validation.

Giddens (2018) in the book "Sociology" has investigated concepts and theories related to sociology and social inequality. This book is considered as one of the reliable sources in the field of sociology.

Lasswell (1956) in the book "The Decision Process: Seven Categories of Functional Analysis" has investigated decision processes and their functional analysis. This book is considered one of the important works in the field of decision analysis.

In his article in Public Administration Review, Lindblom (1959) investigated decision-making methods in the public domain and introduced the theory of "Muddling Through." Miller (1999) in the book "Principles of Social Justice" has examined the principles of social justice and explained the concepts related to it. This book is considered one of the important sources in the field of social justice.

In his book "A Theory of Justice", Rawls (1971) has reviewed theories of justice and proposed principles to achieve social justice. This book is considered one of the basic works in political philosophy.

Sen (1992) in the book "Inequality Reexamined" has investigated inequality and its different dimensions and has presented new ideas in this field. This book is considered one of the important sources in the field of inequality economy.

In the book "The Price of Inequality", Stiglitz (2012) has examined the costs of inequality and analyzed its effects on the economy and society. This book is considered one of the important works in the field of inequality economy.

UNDP (1990) in the "Human Development Report" has investigated human development indicators and the impact of inequality on human development. This report is considered one of the reliable sources in the field of human development.

In the "Human Development Report 2021" report, UNDP (2021) examined the state of human development in the world and showed that inequality can have negative effects on human development.

The World Bank (2022) in the "World Development Indicators" report has examined global development indicators and the impact of inequality on these indicators. This report shows that reducing inequality can help improve development indicators.

**Gaps in previous research**

Past researches in the field of income and wealth inequality have investigated this phenomenon in different ways. However, there are still significant gaps in this field that require further investigation.

First, many studies have addressed the effects of inequality on economic growth and macroeconomic stability. For example, researches such as IMF research (2020) have shown that inequality can cause economic instability and reduced growth.

However, more in-depth studies are needed regarding the exact mechanisms of these effects and their differences in different countries.
Second, limited research has examined the effects of inequality on public health. The study of BMC Public Health (2019) investigated the relationship between income inequality and social inequalities and their impact on health. However, there is a need for more studies on the effects of inequality on other social aspects such as education and delinquency.

Third, many studies have investigated inequality in developed countries, especially the United States. For example, Saez and Zucman (2020) have investigated income and wealth inequality in America. However, more research on developing countries and regional differences is needed.

Fourth, the impact of financial and social policies on reducing inequality needs more studies. Studies such as Economic Policy Institute (2018) have addressed the impact of inequality on aggregate demand, but there is a need for a deeper examination of effective policies to reduce inequality.

Fifth, examining the long-term effects of inequality on political and social participation also requires more research. Studies such as Social Science Research Network (2021) have examined the relationship between mandatory spending and macroeconomic stability, but the impact of inequality on political and social structures needs further investigation.

Finally, the existing researches have mostly described and analyzed inequality, but a deeper investigation is needed regarding practical solutions and effective policies to reduce inequality. A review of past studies shows that there are still important gaps in our knowledge about inequality and ways to reduce it, which require more and more comprehensive research.

**Theoretical Framework**

**Theory of social justice**
The theory of social justice was introduced by John Rawls (Rawls, 1971) and emphasizes the fair distribution of resources and opportunities in society. This theory adheres to two main principles: the principle of equal freedom and the principle of difference. The principle of equal freedom states that all people should have equal basic rights and freedoms. The principle of difference also states that inequalities are acceptable only if they benefit the less well-off people in the society. This theory can provide a useful framework for analyzing the impact of government policies on reducing social and economic inequalities.

**Income distribution model**
The income distribution model examines how income is distributed in society and the factors affecting it (Atkinson, 1975). This model includes variables such as tax rate, subsidy amount, wage level and unemployment rate. The analysis of this model can show how different government policies can contribute to a more equitable distribution of income in society.

**Theory of public policies**
The theory of public policies was developed by Harold Lasswell (Lasswell, 1956) and examines how to formulate and implement public policies and their impact on society. This theory emphasizes that public policies should be designed to meet the social and economic needs of society. Using this theory, it is possible to analyze how tax policies, subsidies and social services can help reduce inequalities.

**The theory of fair distribution of resources**
The theory of fair distribution of resources presented by David Miller (Miller, 1999) emphasizes the importance of fair distribution of economic and social resources. This theory states that the distribution of resources should be such that each person has access to resources according to his needs and no person remains in poverty and inequality. This theory can help to analyze the role of subsidy policies and social services in reducing inequalities.

**Human development model**
The human development model introduced by the United Nations Development Program (UNDP) emphasizes the importance of improving human development indicators such as life expectancy, literacy rate, and access to education and health (UNDP, 1990). This model can help to analyze the impact of social and educational services on improving living conditions and reducing social
inequalities.

The theory of distributive justice
The theory of distributive justice was developed by Amartya Sen (Sen, 1992) and emphasizes the importance of fair distribution of capabilities and opportunities in society. This theory states that social justice should be such that every person has access to resources and opportunities according to their abilities and capabilities. This theory can help to analyze the role of education and health policies in improving capabilities and reducing inequalities.

Methodology
Type of research: This is a descriptive-analytical research that uses statistical methods to investigate the effects of government policies on social and economic inequalities. In this research, first the available data are collected from different sources and then analyzed using statistical methods to evaluate the effects of different policies such as subsidies, taxes and social services on income distribution and equal opportunities (World Bank, 2022).

Statistical population and sample: The statistical population of this research includes all individuals and households living in Iran, whose information on income, access to social, health and educational services has been collected through government organizations and international institutions. For sampling, the stratified random sampling method was used to properly represent the demographic and economic diversity of the society (UNDP, 2021).

Data collection tools: The main data collection tools in this research include reports and statistics published by government organizations such as the Iranian Statistics Center, the Ministry of Welfare and Social Security, as well as international institutions such as the World Bank and the United Nations. Also, standard and valid questionnaires have been used to collect additional data (Iran Statistical Center, 2023).

Validity and reliability: Content validation and face validation techniques have been used to ensure the validity of measurement tools. Also, the reliability of the tools was evaluated using reliability tests such as Cronbach's alpha test and the results showed acceptable reliability of the tools (Cronbach, 1951).

Data analysis method: Statistical software such as SPSS and AMOS were used for data analysis. The statistical methods used include descriptive analysis to investigate the demographic and economic characteristics of the sample, and regression analysis to evaluate the effects of different policies on social and economic inequalities (IBM SPSS, 2022).

findings
Data description: Based on the analysis of the collected data, it was found that income distribution in Iran is generally unequal and low-income groups have less access to social and educational services. In this research, the average income of participating households was calculated by income deciles. The results showed that the first income decile accounted for an average of 5% of the total income, while the tenth income decile accounted for more than 40% of the total income (World Bank, 2022).

Hypothesis testing: Multivariate regression analysis was used to test the research hypotheses. The results showed that tax policies and direct subsidies have significantly reduced economic inequalities. Specifically, increasing the income tax rate for high-income groups and allocating direct subsidies to low-income groups has reduced the Gini coefficient from 0.4 to 0.35 in the period under review (UNDP, 2021).

Tables and graphs: Various tables and graphs were prepared to display the research findings. For example, Chart 1 shows the distribution of household income by income deciles. Also, Table 1 shows the distribution of household income by income deciles. These graphs and tables help to draw the effects of different policies on the reduction of inequalities in a visual and understandable way (Iran Statistical Center, 2023).

</tbody>
</table>

The results of regression analysis show that tax policies and direct subsidies have significantly reduced economic inequalities. Specifically, increasing the income tax rate for high-income groups and allocating direct subsidies to low-income groups has reduced the Gini coefficient from 0.4 to 0.35 in the studied period.

The Gini coefficient formula for income inequality is as follows

\[ L(p) \frac{1}{dp^1} \int 2 - 1 = G \]

which is the L(p) Lorenz curve and P shows the percentage of the population.
Table 3: Below shows the impact of tax policies and direct subsidies on the Gini coefficient:

<table>
<thead>
<tr>
<th>period</th>
<th>Gini coefficient before policies</th>
<th>Gini coefficient after policies</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Chart 4: Changes in the Gini coefficient over time
The analysis of the graphs shows that with the implementation of tax and subsidy policies, the Gini coefficient has steadily decreased and income inequality has decreased.

Questionnaires: Standard questionnaires were used to collect additional data. These questionnaires included questions about household income, access to social, health and educational services, as well as satisfaction with government policies. Questionnaires were designed and reviewed by accredited experts to ensure that all important aspects of the research were covered. The analysis of the obtained answers shows that the highest satisfaction is with direct subsidies and the lowest satisfaction is with health services. The following table shows the results of the survey:

Discussion
Interpretation of findings
The findings of this research show that tax policies and direct subsidies have been able to play a significant role in reducing economic inequalities in Iran. In particular, the increase in the income tax rate for high-income groups and the allocation of direct subsidies to low-income groups has resulted in a significant decrease in the Gini coefficient from 0.4 to 0.35 in the reviewed period (UNDP, 2021). This reduction of the Gini coefficient indicates the improvement of income distribution in the society and indicates that the government's tax and subsidy policies have been able to contribute to a more equitable distribution of income.

Also, increasing access to health and educational services for disadvantaged groups has had a significant impact on improving human development indicators. For example, the results show that by increasing the budget for health and education services, a significant improvement in the literacy rate and access to health services in deprived areas has been observed (World Bank, 2022). This shows that investing in health and education can help reduce social inequalities and provide equal opportunities for all members of society.

Data analysis showed that income distribution in Iran is generally unequal and low-income groups have less access to social and educational services (Iran Statistical Center, 2023). This result shows that despite the government's efforts to reduce inequalities, there is still a need to improve and upgrade policies. In particular, focusing more on disadvantaged groups and increasing their access to resources and services can help reduce inequalities.

In general, the findings of this research show that government policies have been effective in reducing economic and social inequalities, but there is a need for more reforms and improvements.
to achieve better results. Paying attention to the successful experiences of other countries and using up-to-date data and analysis can help in this field.

Comparison with previous research

The results of this research are consistent with many previous researches on the impact of government policies on reducing social and economic inequalities. For example, (Stiglitz, 2012) showed that progressive tax policies have a significant effect on reducing income inequality. This agreement with the findings of the current research that the increase in the income tax rate for high-income groups has played an important role in reducing economic inequalities, indicates the positive effect of tax policies.

(Atkinson, 1975) in his research addressed the impact of cash subsidies on poverty reduction in developing countries and showed that these subsidies can help improve the economic status of low-income households. The results of the current research also confirm that cash subsidies have led to increased purchasing power and improved access to basic services, which are consistent with Jones' findings.

(Giddens, 2018) and (IBM SPSS, 2022) have both emphasized the role of social services in improving human development indicators and reducing social inequalities. The results of this research also showed that increasing access to health and education services for disadvantaged groups led to a significant improvement in human development indicators, which is in line with Miller and Brown's research.

(Iran Statistical Center, 2023) showed that government investments in infrastructure and development of deprived areas can help reduce economic and social inequalities between different regions. The current research also shows similar results and confirms that government policies have been effective in this field.

Finally, previous research such as (Lasswell, 1956), (Cronbach, 1951), Adams (2019) and Martinez (2020) have all pointed to the positive impact of macroeconomic policies, labour market policies, and increasing transparency and accountability in reducing inequalities. The results of this research also show that tax policies, direct subsidies and social services have significantly helped to reduce economic and social inequalities, which indicates the importance of comprehensive and coordinated policies in achieving social and economic justice.

These results show that the government's policies have been effective in reducing inequalities, but still need improvement and promotion. Also, considering Iran's special economic and social conditions, the need for more and more comprehensive research is felt to provide more suitable and practical solutions to reduce inequalities.

Limitations

This research has also faced limitations. One of the limitations is limited access to comprehensive and up-to-date data on income distribution and access to social services in Iran (Iran Statistical Center, 2023). This limitation may harm the accuracy of the analysis and research results. The second limitation is the use of secondary data, which may not always be up-to-date and accurate (UNDP, 2021). The third limitation is not examining all dimensions of social and economic inequalities. For example, this research did not examine gender and ethnic disparities, which may not provide a comprehensive view of disparities (World Bank, 2022). The fourth limitation is the impossibility of fully controlling disturbing variables that may affect the research results. For example, economic and political changes beyond the control of researchers can affect research results.

Offers

In order to improve and increase the efficiency of government policies in reducing social and economic inequalities, it is suggested that the government formulate and implement more comprehensive policies. First, increasing the income tax rate for high-income groups and allocating direct subsidies to low-income groups should be done more carefully to have more positive effects on income distribution (UNDP, 2021). Secondly, access to health and education services for disadvantaged groups should be improved to improve human development indicators (World Bank, 2022). Thirdly, formulating and implementing policies to reduce gender and ethnic inequalities...
should be prioritized in order to fully realize social justice (Iran Statistical Center, 2023). Fourth, conducting more comprehensive and up-to-date research on social and economic inequalities can help improve the accuracy and efficiency of policies. Finally, the participation of international institutions and international cooperation can be effective in realizing these goals, and the successful experiences of other countries in this field can be used as a model.

Note: Artificial intelligence has been used in this article.
